Anaesthesia in Dental Surgery

Although the fall in tooth decay in children since the 1970s has contributed to a reduction in the administration of dental general anaesthesia (DGA), there is a wide variation in its use throughout the UK which cannot be accounted for by variations in dental health alone. There will always be a proportion of the population for whom DGA will be appropriate, and the question of safety of DGA remains paramount. With this in mind the Committee, at the behest of UK Health Ministers, has produced their independent report on standards of clinical care, access and availability of services to NHS patients for dental treatment that may require the administration of a general anaesthetic. The Government's Response is published with this report.

Anaesthesia in Dental Surgery

Anesthetic complications, which range from simple annoyances to patient mortality, are inevitable, given the many and complex interactions of doctor, patient, personnel, and facility. Anesthesia Complications in the Dental Office helps dentists minimize the frequency and severity of adverse events by providing concise and clinically relevant information that can be put to everyday use. Anesthesia Complications in the Dental Office presents the most up-to-date information on treating anesthesia complications and medical emergencies. Drs. Bosack and Lieblich and a team of expert contributors discuss patient risk assessment; considerations for special needs and medically compromised patients; routinely administered anesthetic agents; adversities that can arise before, during, and after administration of anesthesia; and emergency drugs and equipment. A must-have reference for every dental office.

Excerpt from Anaesthesia in Dental Surgery The progress made in anaesthetic methods during the past two years has necessitated considerable alteration in the text of the previous edition of this little work. Our knowledge of the advantages and the drawbacks of ethyl chloride has been greatly increased during that period, and the section on this anaesthetic has been rewritten in its entirety. The growing popularity of various forms of local anaesthetics has led the author to introduce a great deal of new matter on this most interesting subject. A special chapter has been devoted to the much-debated question - How far is the L.D.S. diplomate entitled to administer the various anaesthetics? Anesthesia in Dental Surgery

Excerpt from *Local Anesthesia in Dentistry: With Special Reference to the Mucous and Conductive Methods*, a Concise Guide for Dentists, Surgeons and Students. While efforts toward the abolition or reduction of pain are inseparably interwoven with the history of the human race, it was not until the introduction of general anesthesia with nitrous oxid by Wells in 1844, with ether by Morton in 1846, and with chloroform by Simpson in 1847, that "the beautiful dream of the elimination of pain became a reality," to use Dieffenbach's words. Local anesthesia, although prior to 1884 it had been induced by freezing, as by salt and ice, ether, and ethyl chlorid, did not attain general popularity before that year, when Roller demonstrated the anesthetic properties of cocain. Since then the advance of surgical anesthesia, both general and local, toward perfection has reached a remarkable point of development, for the attainment of which humanity owes to dentistry no less a debt of gratitude than it does to medicine. In operative interventions in the oral cavity, which, while involving but a limited area, are so extremely painful, local anesthesia seemed from the beginning to be specially indicated; in fact, so welcome has been the elimination of pain in dentistry that the limits necessarily attaching to this beneficent aim have at times been overstepped, and progress has been jeopardized, and legitimate and conscientious effort discredited by the exploits in "painless dentistry" of unethical practitioners. The ethical dentist should, therefore, gladly avail himself of a guide which, issuing from the pen of a recognized authority, will aid him in adopting a safe and scientific method of inducing local anesthesia, in raising the standard of his operative work, in sparing pain to his patients, and conserving his own nervous energy.
